

Active Fires in the past 20 Years in the Miombo Woodlands

presented at 1st Niassa Special Reserve Science Meeting
and Miombo Network Meeting, 03 and 04 June 2021

by Sylvia Thompson & Jörg Helmschrot

Intro

- Wildfires are **historically** part of southern African landscape
- Fire season in southern Africa tend to coincides with **agricultural burning season**
- Fire regime in southern Africa has generally **shifted to the dry season** months' preceding the rainfall season
- Controlled fire management before the rainy season through **early burning** avoids out-of-control wildfires & protects, as well as increases biodiversity
- Yet, numerous studies have also suggested **detrimental effects** of regular annual burns on the landscape biodiversity and drive landcover changes

Data

Characteristic

NASA FIRMS MODIS Active Fire

Historic record

November 2000 to
date

Resolution

1 km gridded

Extent

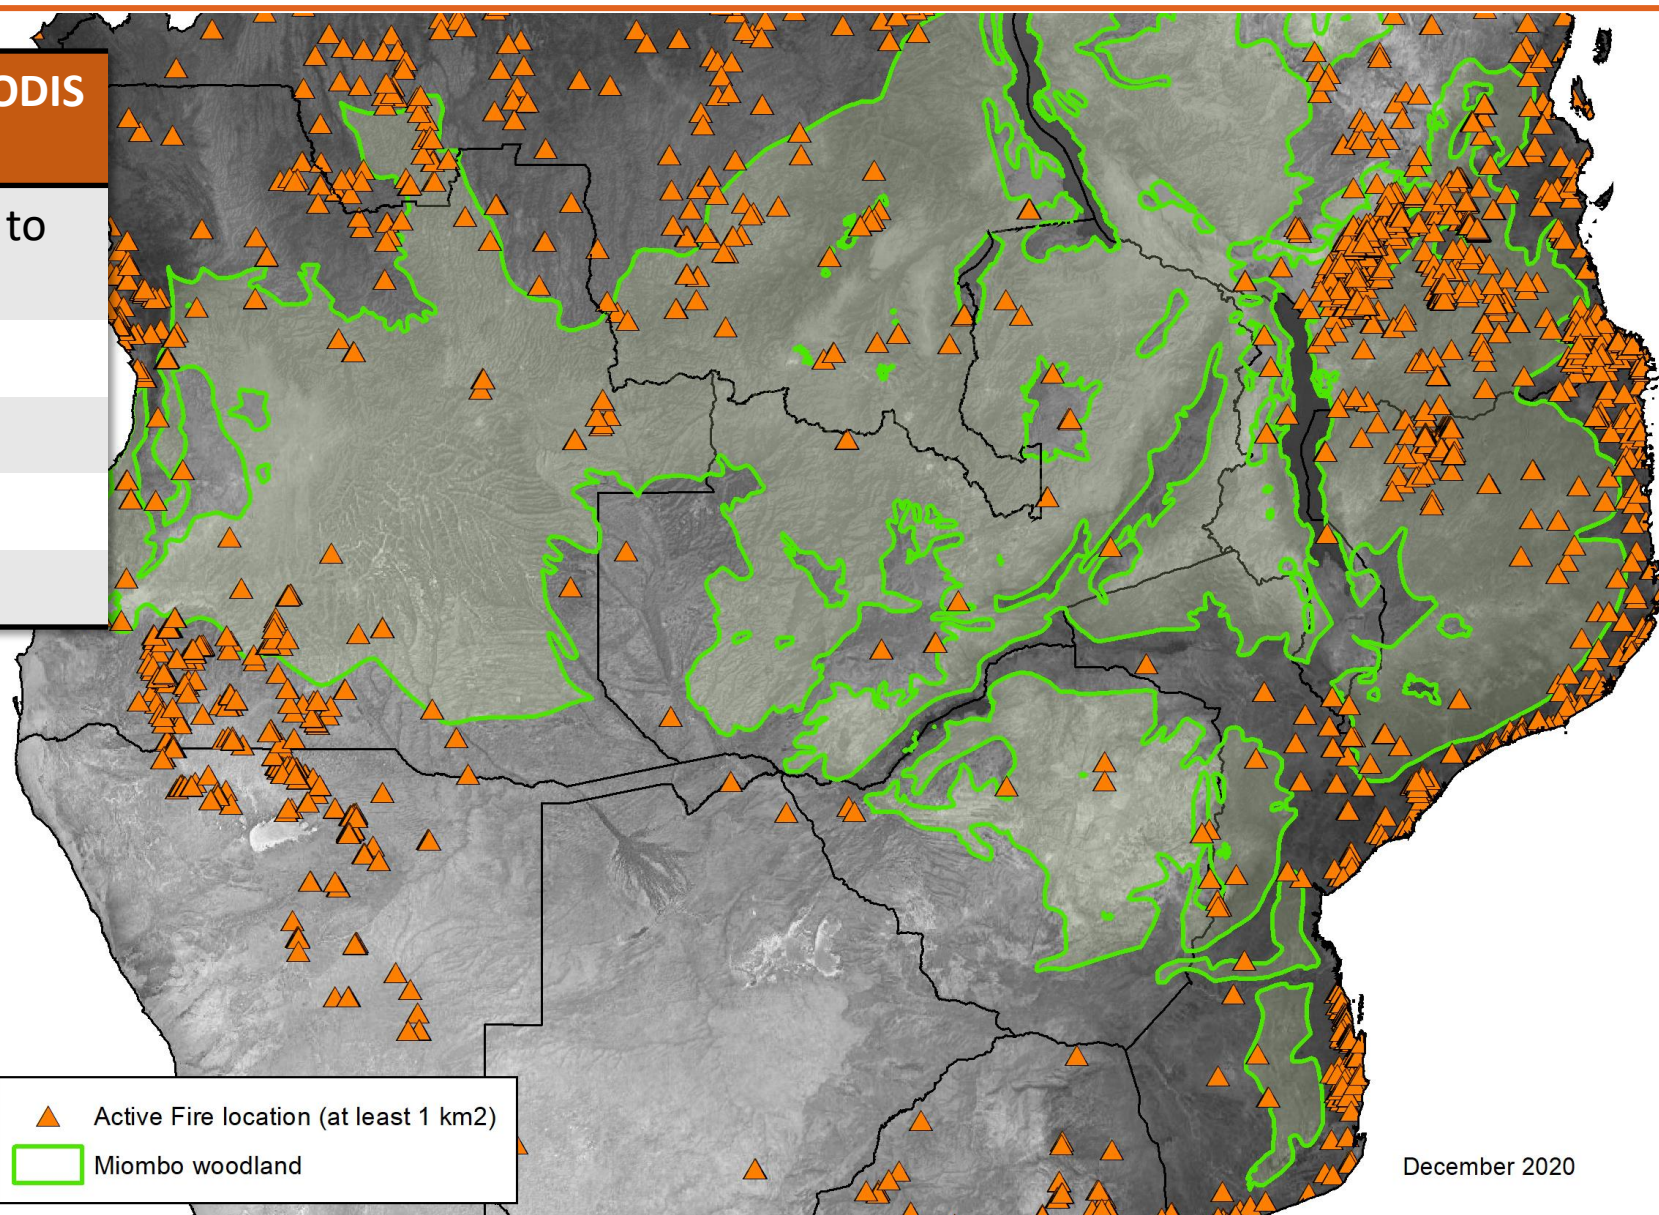

Global

Format

SHP file

Temporal Resolution

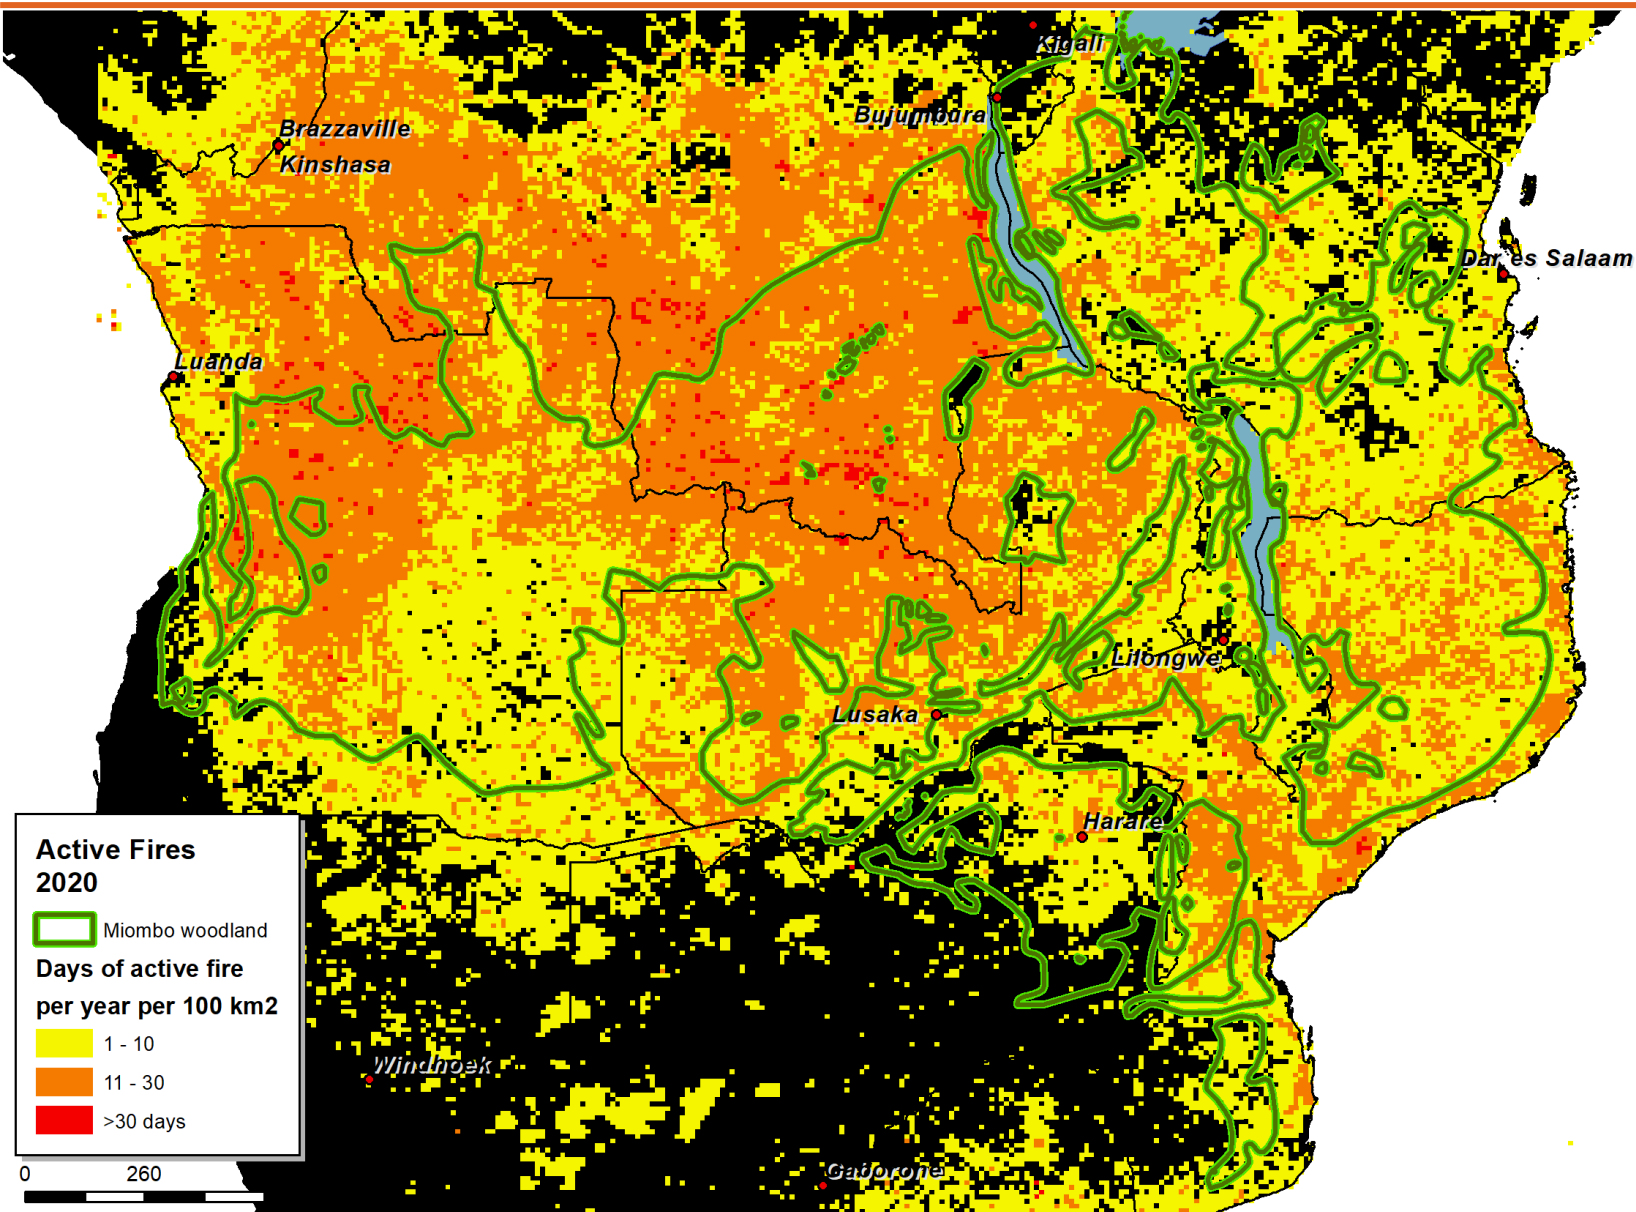

Daily

December 2020

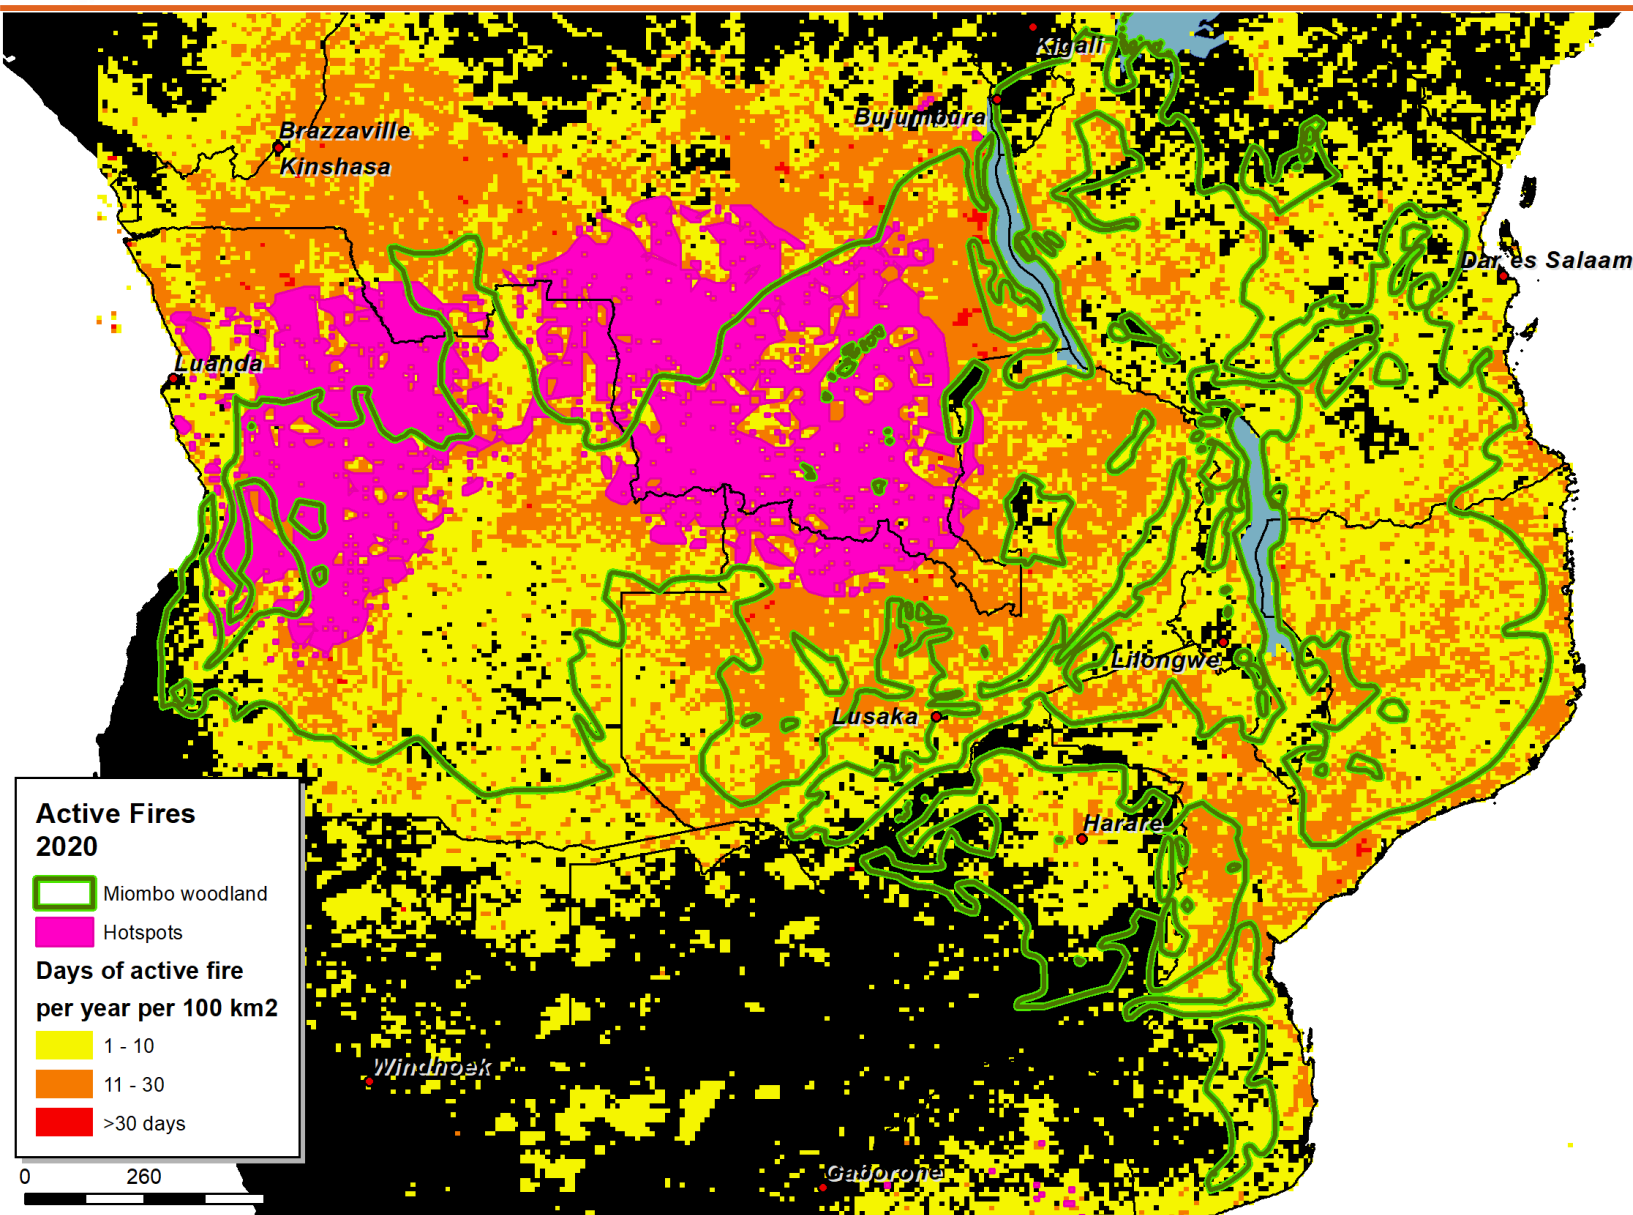

Active fire areas & frequency in 2020

- Per 10 km by 10 km grid cell, the number of days that active fires were detected in this area

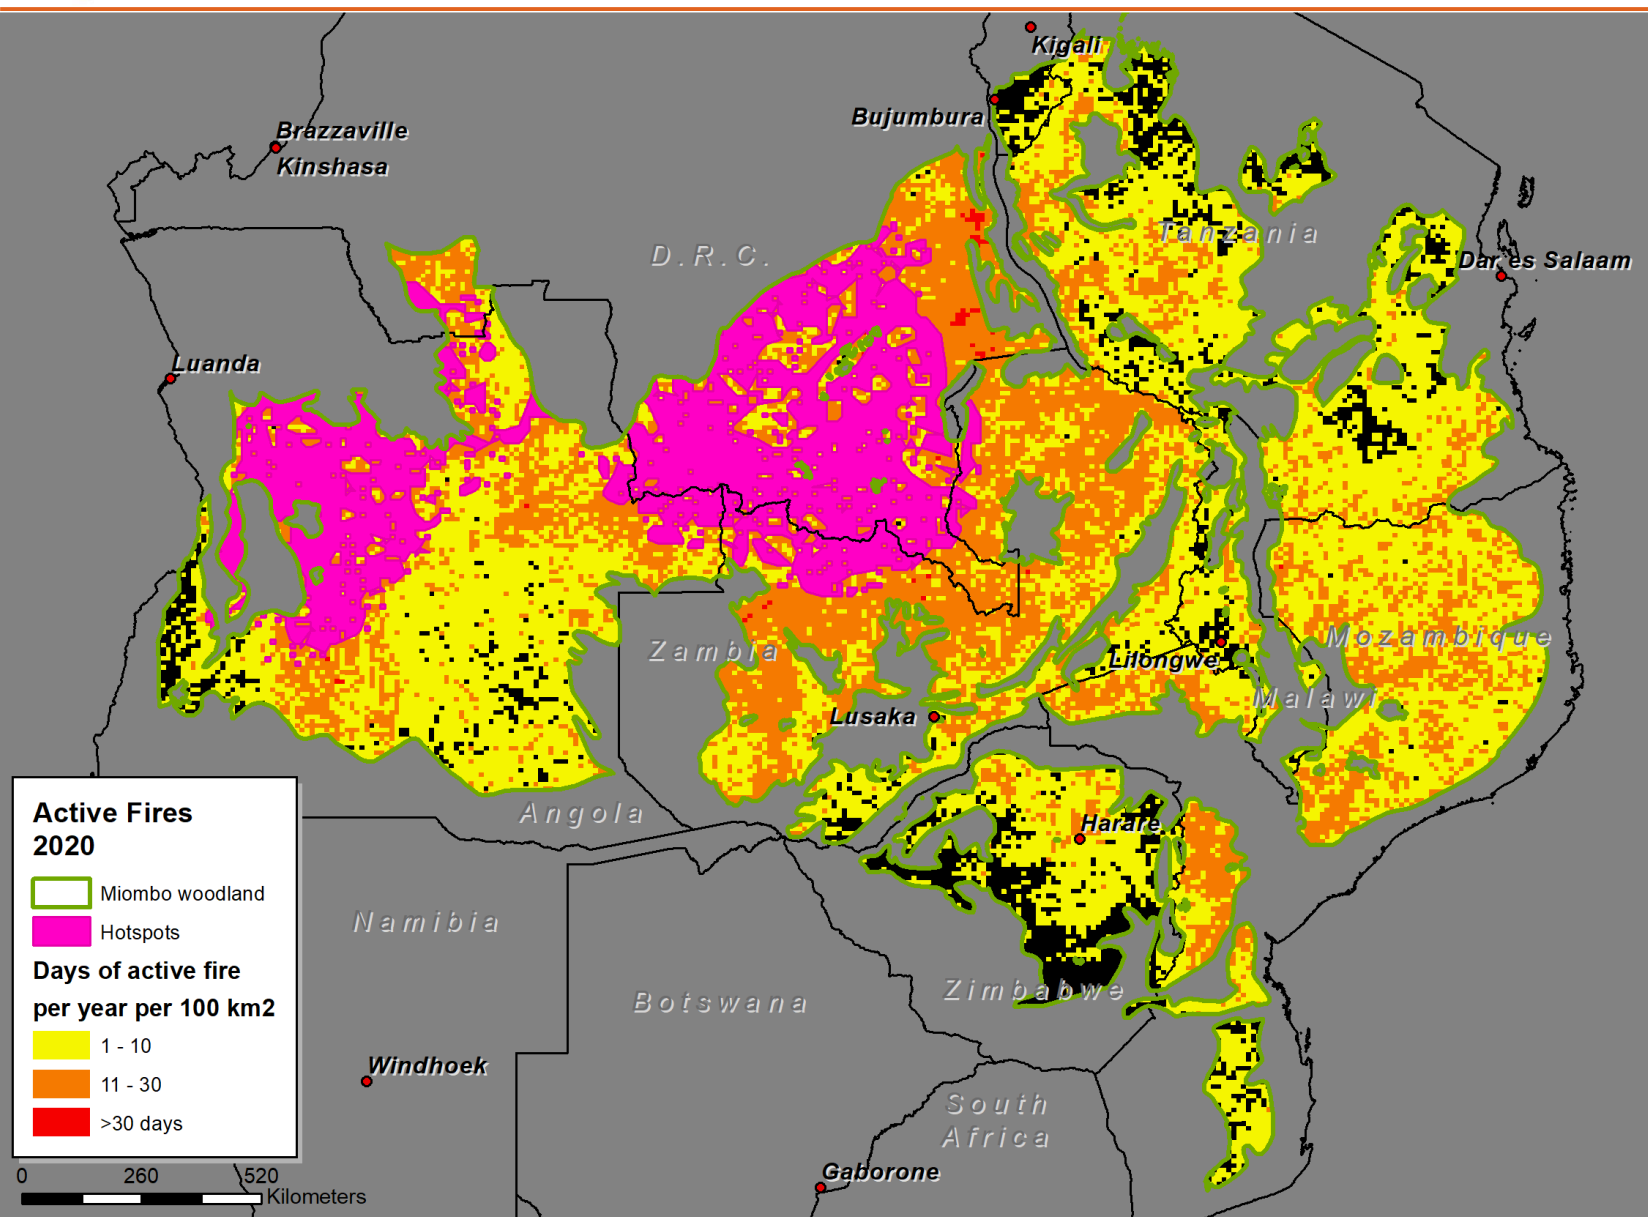

2020 Hotspots

- Statistically significant hot spots using the Getis-Ord G_i^* statistic
- Statistical significance with a > 90 % confidence level

2020 Area Summaries

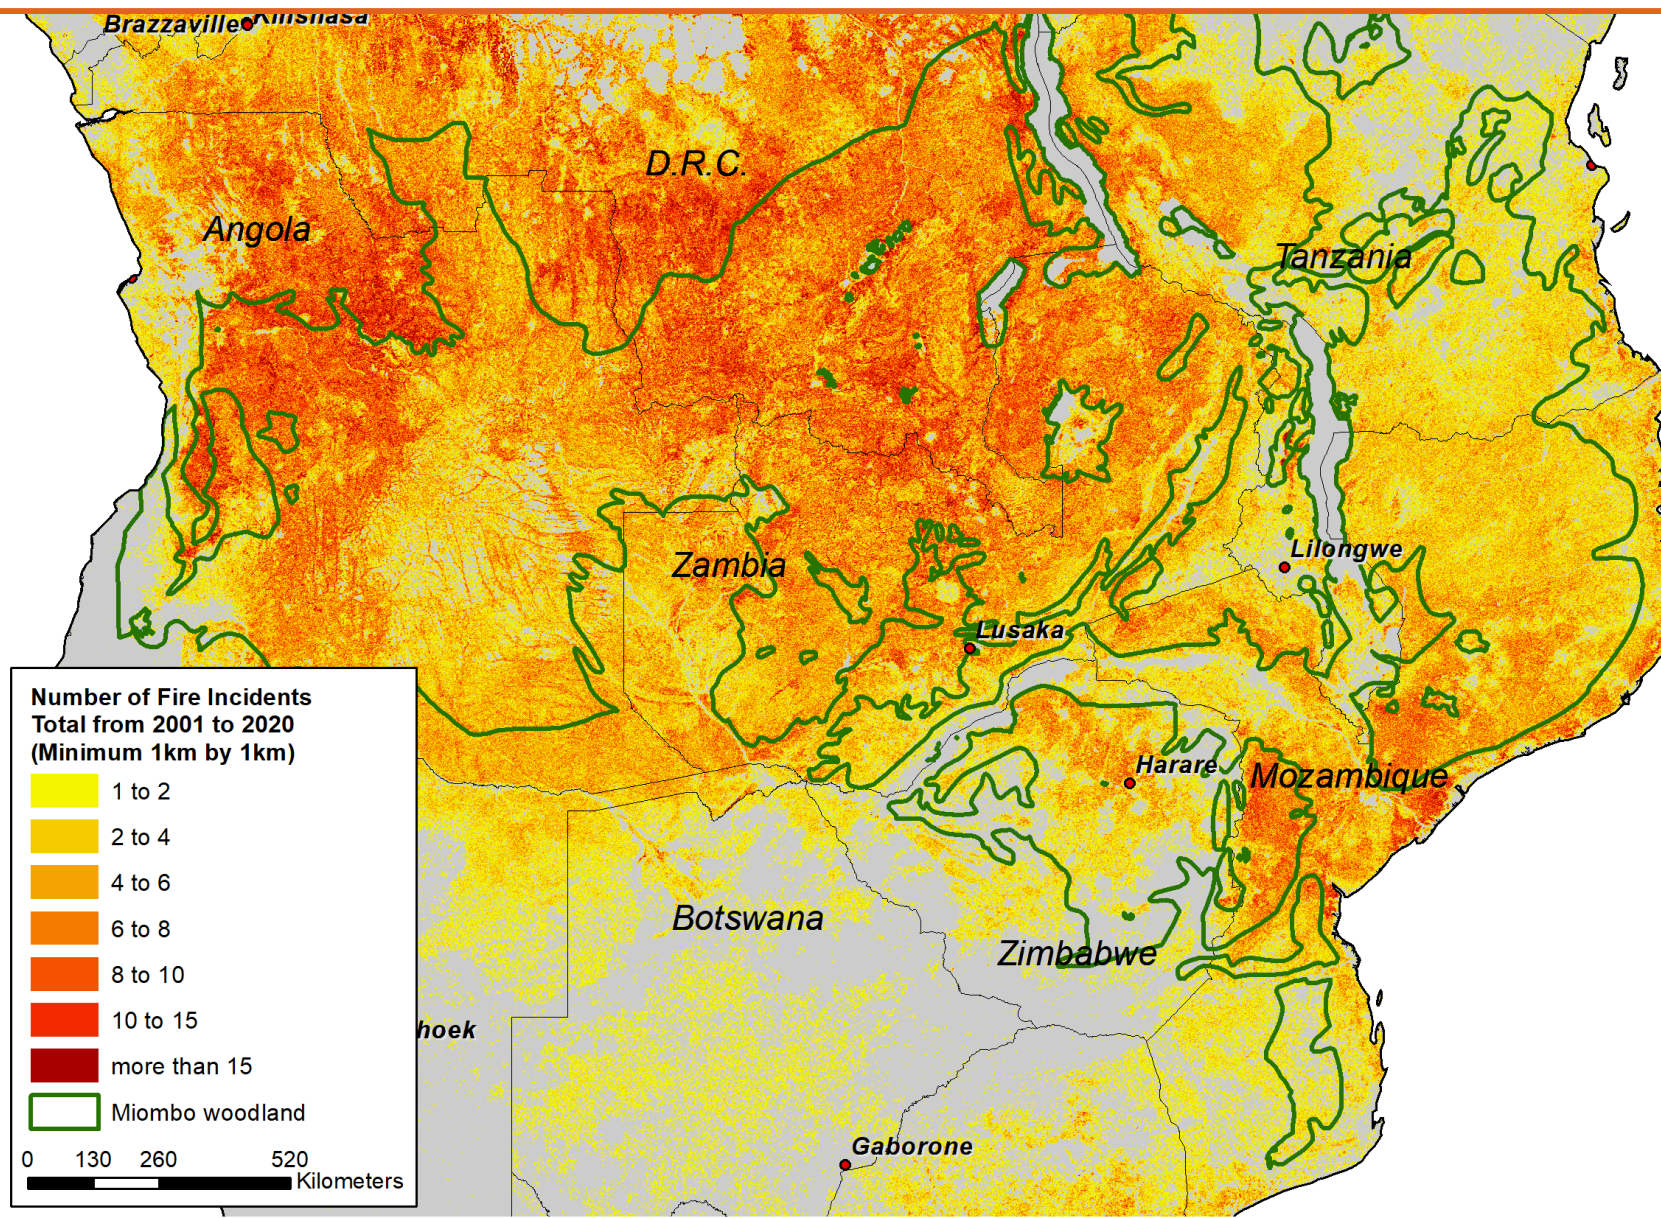

Miombo woodlands ~
2,709,000 km²

Areas of active fires
~ 487,000 km²

Areas of hot spots
~ 153,000 km²

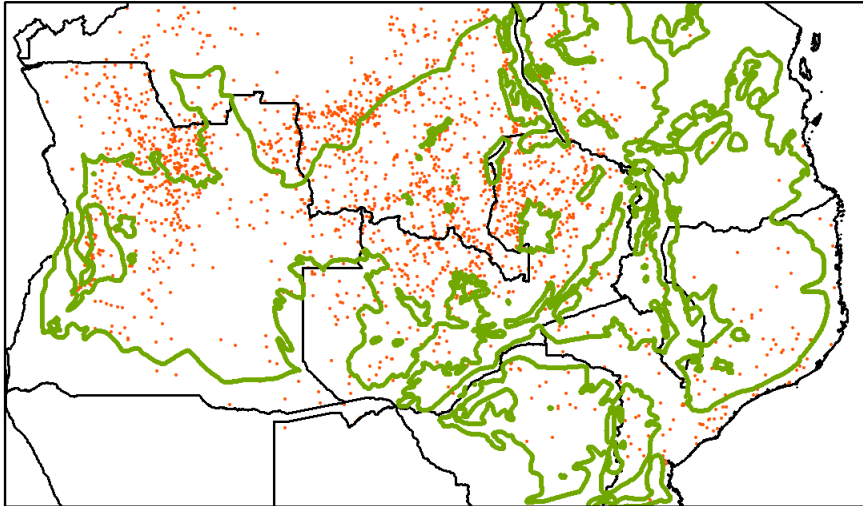

Active fire areas & frequency in past 20 years

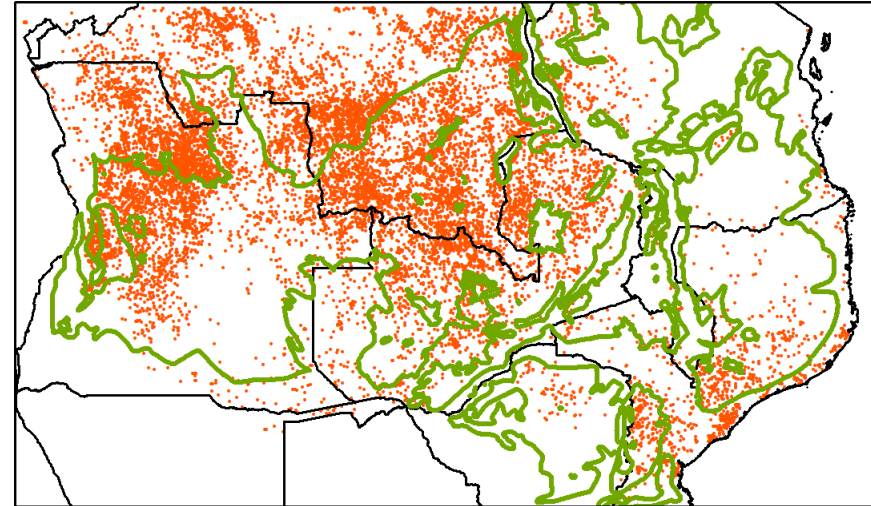

Annual fires in past 20 years

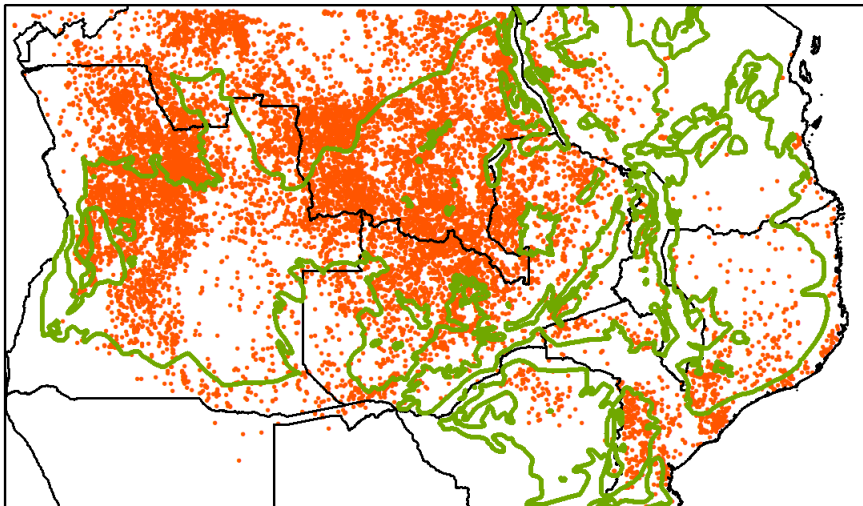

Burned annually from 2001 to 2005

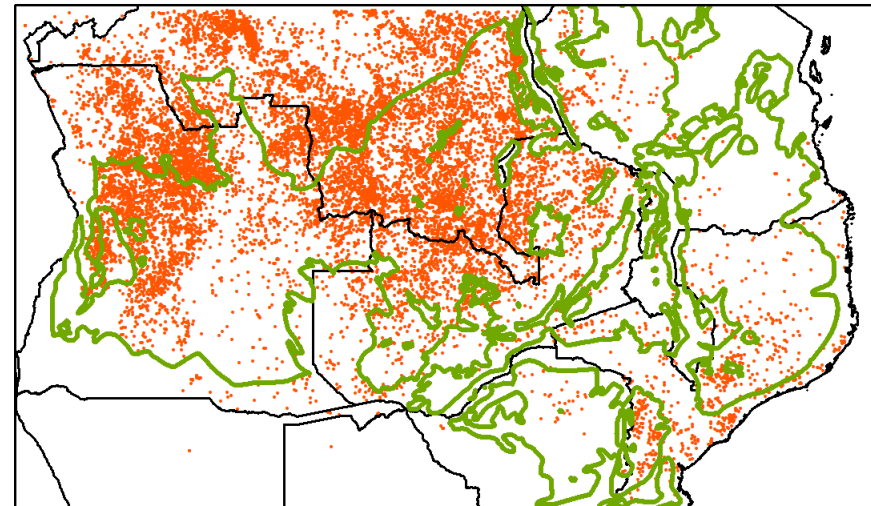

Burned annually from 2006 to 2010

Burned annually from 2011 to 2015

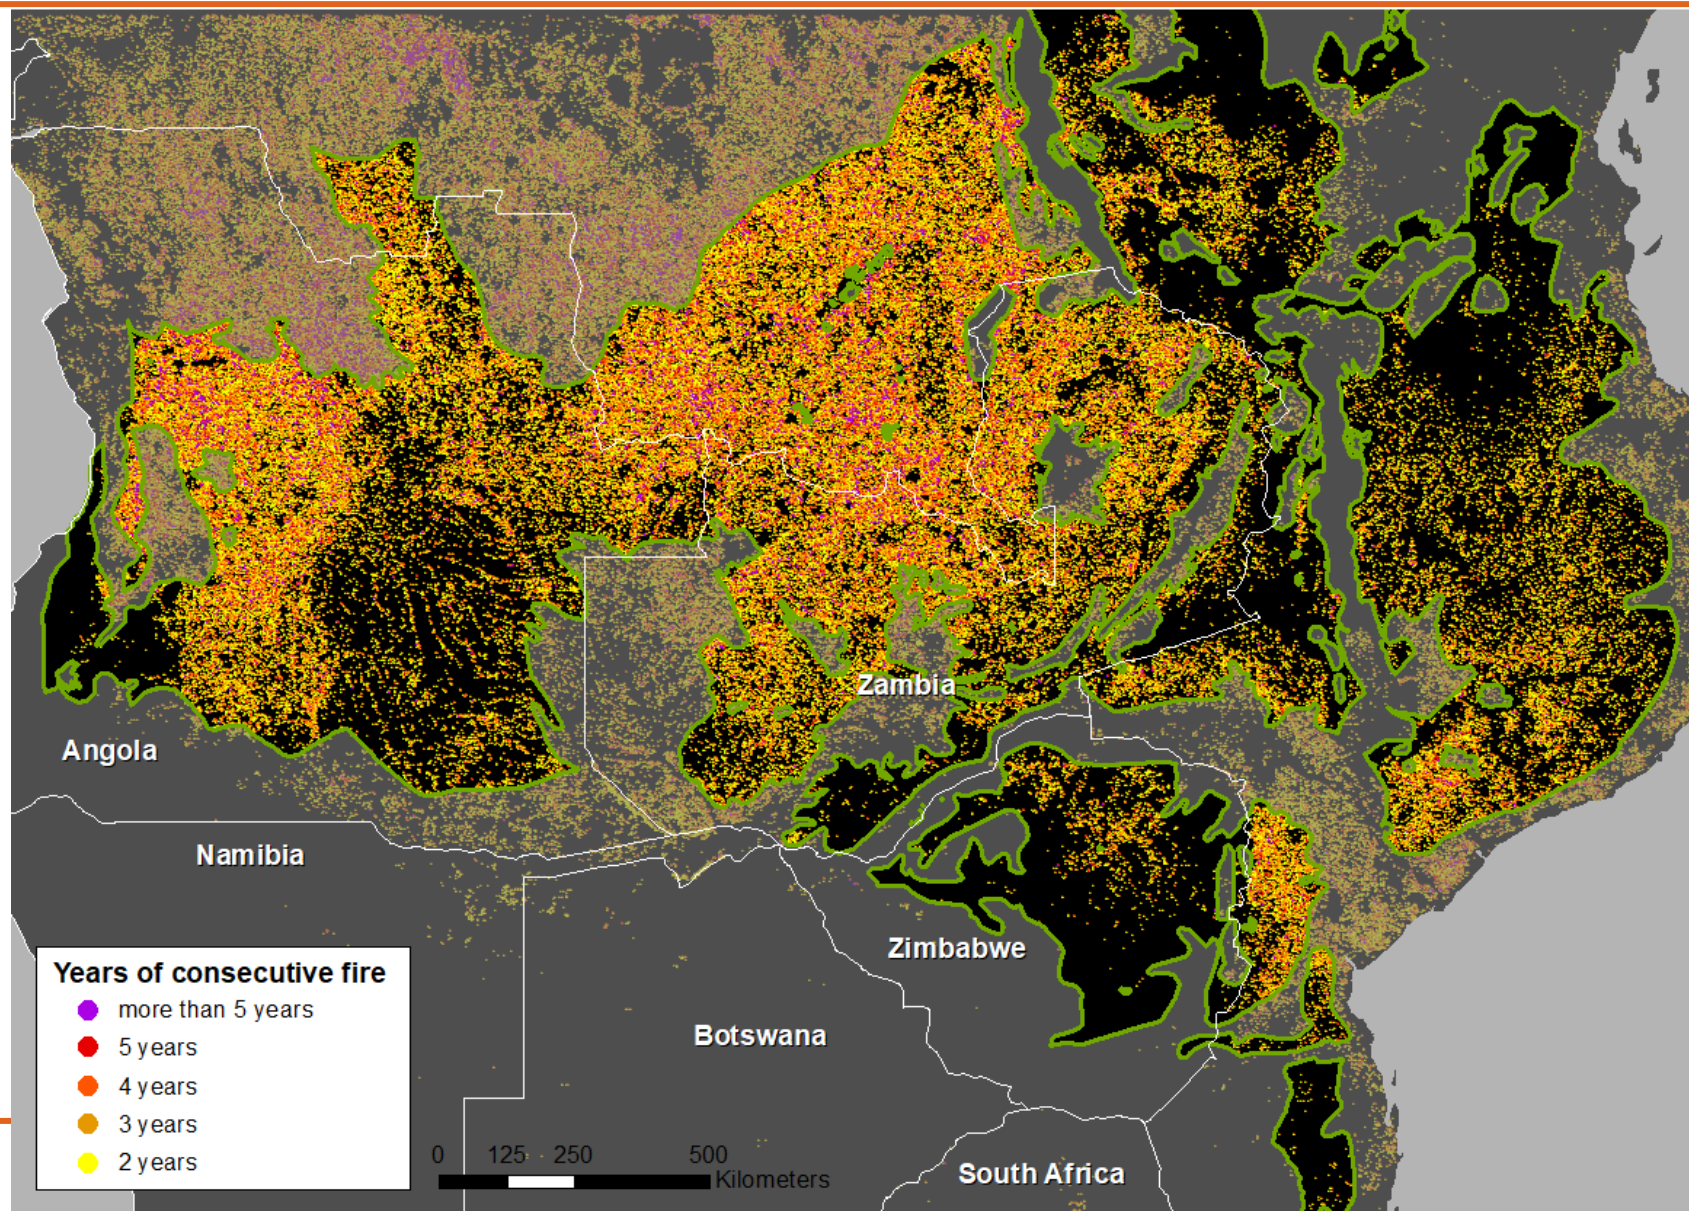

Burned annually from 2016 to 2020

Consecutive burning in past 20 years

Some other interesting statistics

Average Areas with detected Active Fires (2001 to 2020)

Some other interesting statistics

Active fire area for Angola (km²)

Active fire area for Botswana (km²)

Active fire area for Zimbabwe (km²)

Active fire area for Zambia (km²)

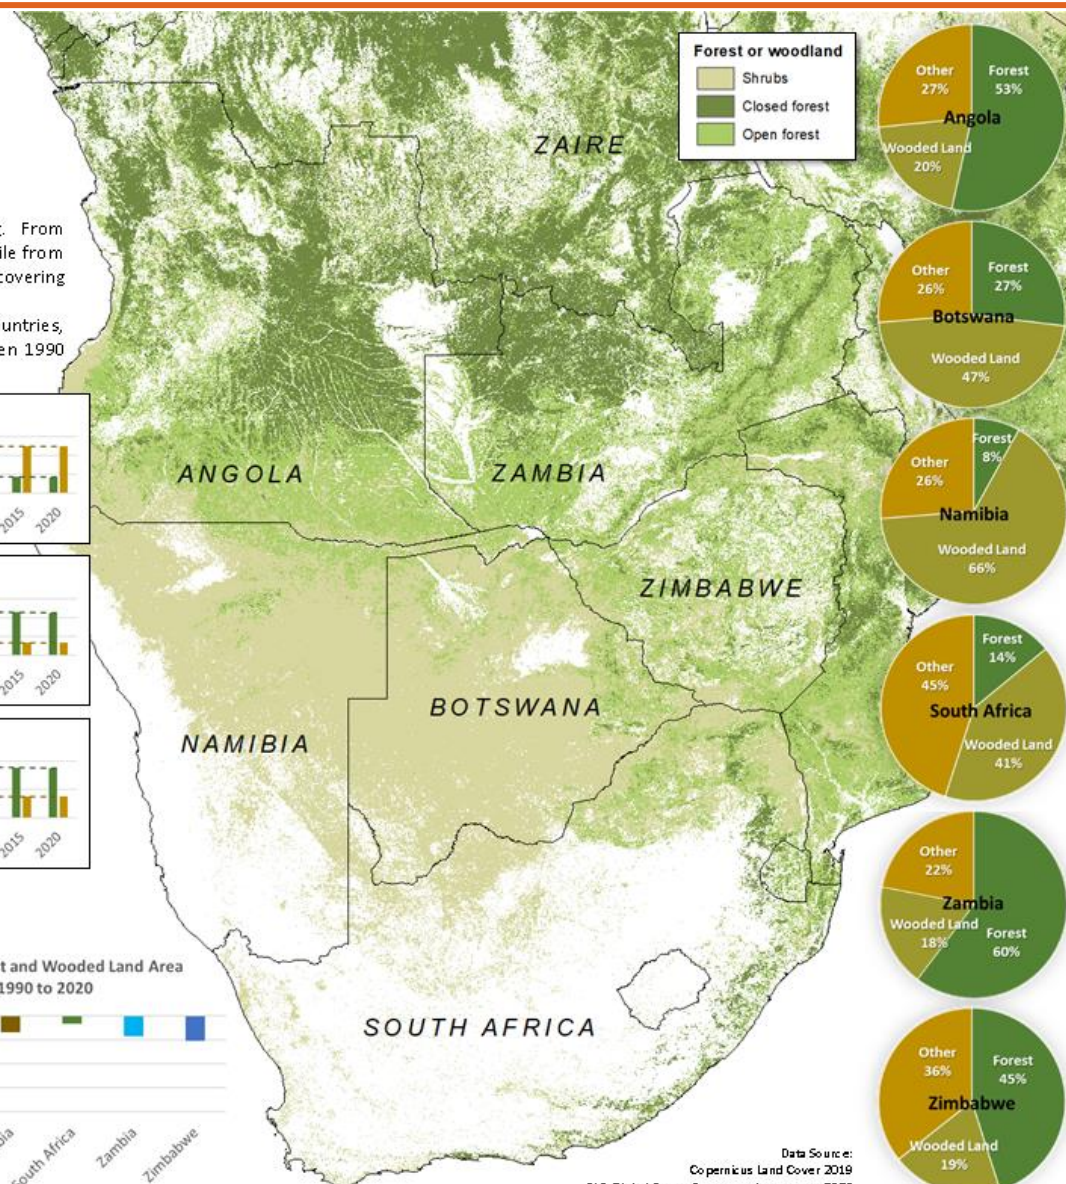

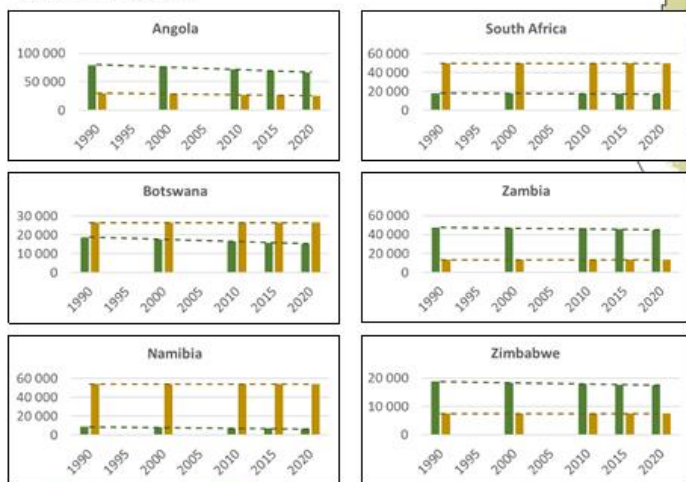

Outlook

SASSCAL Info Map

Deforestation in southern Africa

The forest and wooded land areas in southern Africa are decreasing. From 2015 to 2020, the forest and wooded land areas decreased by 2 %, while from 1990 to 2020, they decreased by 7.5 % in the southern African region covering Angola, Botswana, Namibia, South Africa, Zambia and Zimbabwe. While Angola has the largest forest and wooded land area of the six countries, it lost the greatest percentage of its forest and wooded land between 1990 and 2020 with 16 %.
